Overview

What are cosmic rays

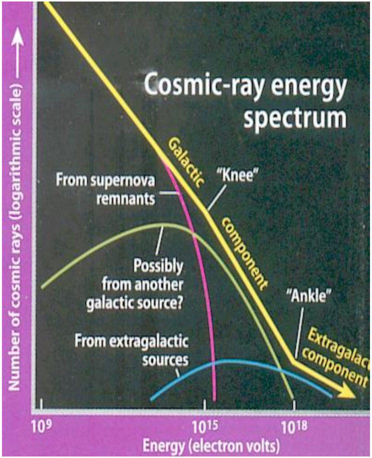

Figure: Cosmic ray feature : retrieved from universe-review.ca

- A high-energey particles that travelling through space
- **Criteria :** When we call flux it means differential flux
- **Feature :** CRs spectrum in rigidity follow power law
- Discontinuity in spectrum came from superposition of different acceleration mechanism

Motivation

In 2015, the AMS collaboration claims that there is a broken in cosmic ray proton spectrum around 336 GV.

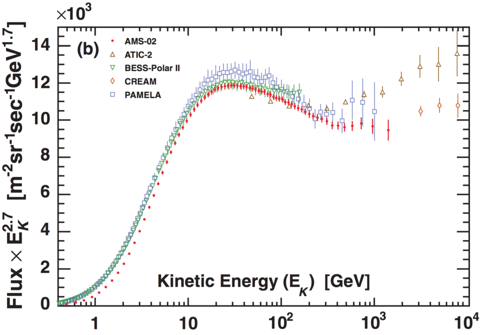

Figure: Cosmic rays proton flux : retrieved from M. Aguilar et al. (2015)

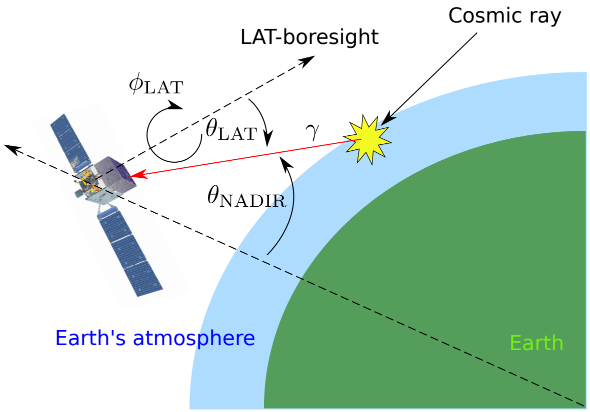
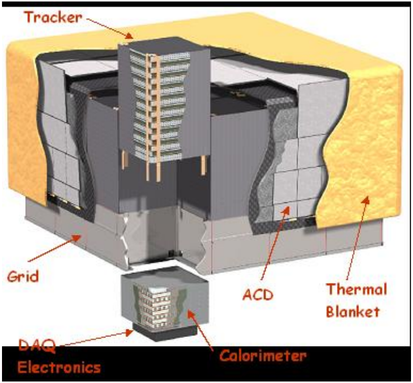
Objective

- Want to measure cosmic ray proton spectrum in range GV by using γ-ray data from *Fermi* Large Area Telescope (LAT) through Kachelrieβ and Ostapchenko model
- Some intruments claim that cosmic ray proton spectrum has discontinuity around 200-350 GV , then if our result agree with other intruments. Space might have another acceleration mechanism that people did not know very well.

Schematics of limb γ-ray production

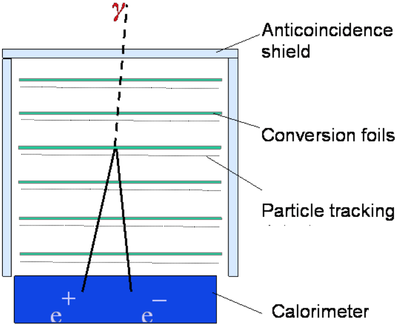


Fermi Large Area Telescope



- 18 layers of silicon strip tracker on a horizontal planes
- Each calorimeter (CAL) contains CsI(TI) cristal scintillator
- Anti coincidence detector frontend device
- Data acquisition (DAQ) module to digitize a signal

Event Reconstruction



- Incident photon hit conversion foils and produce a pair of leptons
- Lepton pair be detected by scintillator crystal
- Process a track and deposit energy in CAL to reconstruction an event

Data selection

- P8R2_ULTRACLEANVETO_V6 data from 07/08/2008 to 16/10/2017 ($\sim$ 9 years)
- Collect photon energy range from 10 GeV up to 1 TeV
- $\theta_{\text{NADIR}} \in 68.4^\circ$ - 70° (Earth's limb)
- Use $\theta_{\text{LAT}} < 70^\circ$

Calculation method

1. Make 2D histogram as much as energy bin that we want
2. Select photon data and fill in the 2D histogram
3. Calculate exposure maps which incldue effective area and time that LAT view can looking at Earth's limb

   $$\textbf{Flux} = \frac{dF}{dE} = \frac{\int_{\text{Limb region}} (\text{Count map}/\text{Exposure map})}{\Delta\Omega\Delta E}$$
4. Divide every single grid of couple histogram (count map and exposure map)
5. Sum over limb region of this map then divided by solidangle and energy bin width
6. Now we got γ-ray flux

Coordinate Transformations

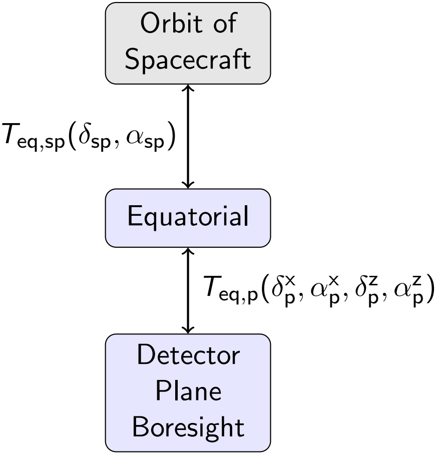


Figure: Three reference frames

Coordinate Transformations

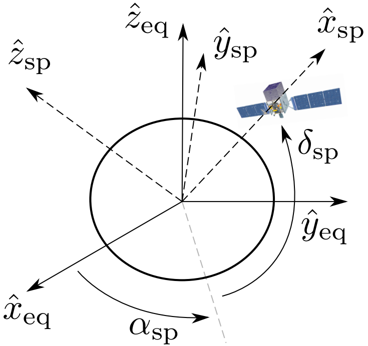

Figure: Coordinate transform between equatorial and spacecraft

Coordinate Transformations (SP-EQ)

Write the unit vector of orbiting spacecraft on a basis of equatorial coordinate

$$\begin{aligned} \hat{x}_{\mathrm{sp}} &= \cos\delta_{\mathrm{sp}}\cos\alpha_{\mathrm{sp}}\hat{x}_{\mathrm{eq}} + \cos\delta_{\mathrm{sp}}\sin\alpha_{\mathrm{sp}}\hat{y}_{\mathrm{eq}} + \sin\delta_{\mathrm{sp}}\hat{z}_{\mathrm{eq}} \\ \hat{z}_{\mathrm{sp}} &= -\sin\delta_{\mathrm{sp}}\hat{y}_{\mathrm{eq}} + \cos\delta_{\mathrm{sp}}\hat{z}_{\mathrm{eq}} \\ \hat{y}_{\mathrm{sp}} &= \hat{z}_{\mathrm{sp}} \times \hat{x}_{\mathrm{sp}} \end{aligned} \tag{1}$$

Transformation matrix could be extracted from the relation

$$\hat{r}_{\mathrm{sp}} \equiv T_{\mathrm{eq}\to\mathrm{sp}}(\delta_{\mathrm{sp}}, \alpha_{\mathrm{sp}})\hat{r}_{\mathrm{eq}} \tag{2}$$

Coordinate transformations (P-EQ)

Unit vector of detector plane on a basis of equatorial coordinate

$$\begin{aligned} \hat{x}_\mathrm{p} &= \cos\delta_\mathrm{p}^\mathrm{x}\cos\alpha_\mathrm{p}^\mathrm{x}\hat{x}_\mathrm{eq} + \cos\delta_\mathrm{p}^\mathrm{x}\sin\alpha_\mathrm{p}^\mathrm{x}\hat{y}_\mathrm{eq} + \sin\delta_\mathrm{sp}^\mathrm{x}\hat{z}_\mathrm{eq} \\ \hat{z}_\mathrm{p} &= \cos\delta_\mathrm{p}^\mathrm{z}\cos\alpha_\mathrm{p}^\mathrm{z}\hat{x}_\mathrm{eq} + \cos\delta_\mathrm{p}^\mathrm{z}\sin\alpha_\mathrm{p}^\mathrm{z}\hat{y}_\mathrm{eq} + \sin\delta_\mathrm{sp}^\mathrm{z}\hat{z}_\mathrm{eq} \\ \hat{y}_\mathrm{p} &= \hat{z}_\mathrm{p} \times \hat{x}_\mathrm{p} \end{aligned} \tag{3}$$

Then applying the following relation to get transformation matrix

$$\hat{r}_\mathrm{p} \equiv T_{\mathrm{eq}\to\mathrm{p}}(\delta_\mathrm{p}^\mathrm{x}, \alpha_\mathrm{p}^\mathrm{x}, \delta_\mathrm{p}^\mathrm{z}, \alpha_\mathrm{p}^\mathrm{z})\hat{r}_\mathrm{eq} \tag{4}$$

Coordinate transformations from nadir angle

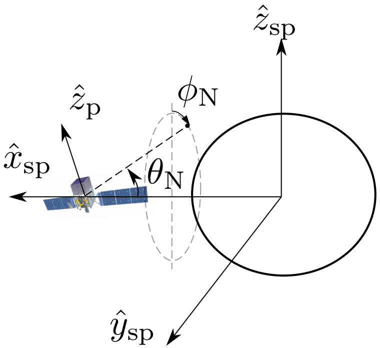

Figure: Coordinate transform between LAT-plane boresight and spacecraft

Coordinate transformations (nadir angle)

Let consider each grid in nadir's solid angle map

$$\hat{r}^{o}_{\mathrm{sp}}(\theta_{\mathrm{N}},\phi_{\mathrm{N}}) \equiv -\cos\theta_{\mathrm{N}}\hat{x}_{\mathrm{sp}} + \sin\theta_{\mathrm{N}}\cos\phi_{\mathrm{N}}\hat{z}_{\mathrm{sp}} + \sin\theta_{\mathrm{N}}\sin\phi_{\mathrm{N}}\hat{y}_{\mathrm{sp}} \tag{5}$$

Convert it back to the plane of detector

$$\hat{r}^{o}_{\mathrm{p}}(\theta_{\mathrm{N}},\phi_{\mathrm{N}}) = T_{\mathrm{eq}\to\mathrm{p}}(\delta^{\mathrm{x}}_{\mathrm{p}},\alpha^{\mathrm{x}}_{\mathrm{p}},\delta^{\mathrm{z}}_{\mathrm{p}},\alpha^{\mathrm{z}}_{\mathrm{p}})\left[T_{\mathrm{eq}\to\mathrm{sp}}(\delta_{\mathrm{sp}},\alpha_{\mathrm{sp}})\right]^{-1}\hat{r}^{o}_{\mathrm{sp}}(\theta_{\mathrm{N}},\phi_{\mathrm{N}}) \tag{6}$$

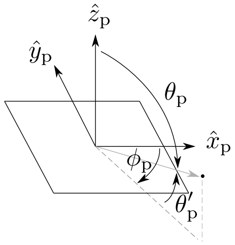

Figure: Detector's boresight in cartesian and polar coordinate

Effective Area

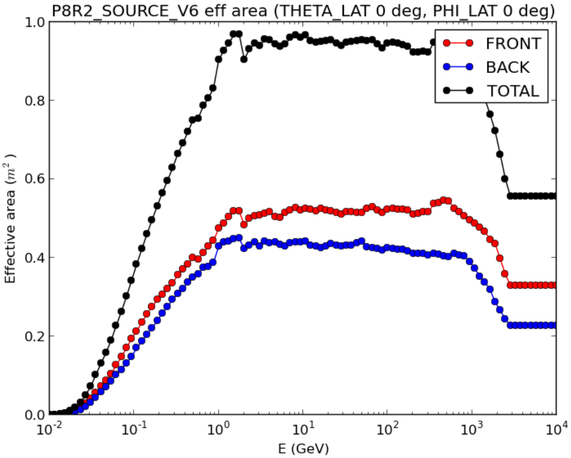

Figure: Effective area of Fermi-LAT

Power law (in rigidity)

Typically, cosmic ray spectrum follow power law in rigidity as

Single power law (SPL)

$$\frac{dN}{dR} = R_0 R^{-\gamma} \tag{7}$$

Broken power law (BPL)

$$\frac{dN}{dR} = \begin{cases} R_0 R^{-\gamma_1} & : \; E < E_{\text{Break}} \\ R_0 [R(E_{\text{Break}})]^{\gamma_2 - \gamma_1} R^{-\gamma_2} & : \; E \geq E_{\text{Break}} \end{cases} \tag{8}$$

Kachelrieβ and Ostapchenko model

Is the model which can compute spectrum of γ-ray from a known incident proton

$$\frac{dN_\gamma}{dE} \propto \sum_{E_{\text{inc,i}}} \left[\frac{E_{\text{inc,i}}}{E_{\gamma,\text{i}}} \Delta(E_{\text{inc,i}}) \right] \left[f_{pp} \frac{dN_{\text{H}}}{dE_{\text{inc,i}}} \left\{ 1 + \frac{\sigma_{\text{HeN}}}{\sigma pN} \left(\frac{dN_{\text{H}}}{dR} \right)^{-1} \frac{dN_{\text{He}}}{dR} \frac{dR_{\text{He}}}{dR_{\text{H}}} \right\} \right] \tag{9}$$

- Red color terms is using for incident proton spectrum
- Use helium spectrum from AMS-02 measurement (2015)
- $f_{pp} \equiv E_\gamma(d\sigma^{pp\to\gamma}/dE_\gamma)$ is a table in K&O model which behave like a scattering amplitude that depend on the energy of incident particle
- Crossection $\sigma_{\text{HeN}}/\sigma_{pN}$ at high energy (> 10GeV) is almost remain constant (≈ 1.6)

Poisson likelihood function

On the previous slide, we want to find the incident proton.
Let define some loss function to compare model and measurement

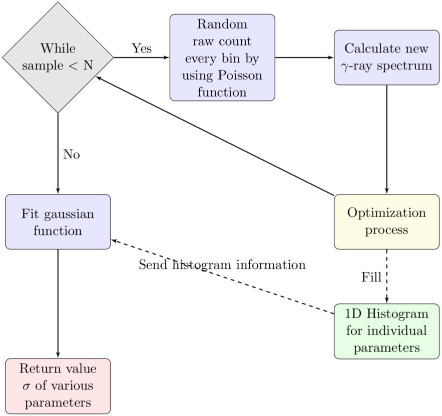
$$\mathcal{L} = \prod_{i=1}^{N} P_{\text{pois}}(n_{\text{i,model}}, n_{\text{i,measurement}}) \tag{10}$$

For numerically convenient, redefined into logarithmic form

$$\log \mathcal{L} \equiv \sum_{i=1}^{N} -\log P_{\text{pois}}(n_{\text{i,model}}, n_{\text{i,measurement}}) \tag{11}$$

This part is the hard work of computer to find best incident cosmic ray proton that match the spectrum from measurement.

Monte Carlo Simulation (Statistical Error)



Monte Carlo Simulation (Total Error)

Exposure maps

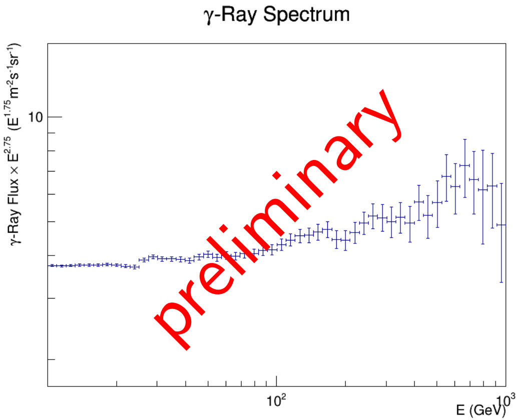
γ-ray spectrum



Please note that the error bar is statictical error and systematic error does not include in this figure.

Outlook

- Determine the significant level of energy breaking in cosmic ray proton
- Put weight on the previous study that the brightenss of γ-ray from Earth's high atmosphere could be use to perform an indirect measurement

Power law in energy

In our case, we use power in energy then we need to convert by relativistic energy-mass relation

Single power law (SPL)

$$\frac{dN}{dE} = N_0[E_k(E_k + 2m_p)]^{-\gamma/2}\left(\frac{E_k + m_p}{\sqrt{E_k(E_k + 2m_p)}}\right) \tag{12}$$

Broken power law (BPL)

$$\frac{dN}{dE} = \begin{cases} N_0[E_k(E_k + 2m_p)]^{-\gamma_1/2}\left(\frac{E_k+m_p}{\sqrt{E_k(E_k+2m_p)}}\right) & : \; E < E_{\text{Break}} \\ N_0[E_b(E_b + 2m_p)]^{(\gamma_2-\gamma_1)/2}[E_k(E_k + 2m_p)]^{-\gamma_2/2}\left(\frac{E_k+m_p}{\sqrt{E_k(E_k+2m_p)}}\right) \\ : \; E \geq E_{\text{Break}} \end{cases} \tag{13}$$

Error determination

Statictical error (Random error)

1. Get back to raw count and random new count in each energy bin by Poisson random function
2. Recalculate proton spectrum
3. Optimize it and store the parameter that we got
4. do it over thoundsand time and fill in histogram to interpret error by saying sigma of gaussian function

Total error (take into account instrument)

1. Get back to raw count and random new count in each energy bin by Poisson random function
2. Random value we got again by systematic error (Apparatus)
3. Recalculate proton spectrum
4. Optimize it and store the parameter that we got
5. do it over thoundsand time and fill in histogram to interpret error by saying sigma of gaussian function
